

S003 GreenCart Organics - Onboarding Project Plan and Closure

Project Document | Operations

Document ID	PRJ-S003-001	Seller ID	S003
Department	Operations	Classification	CONFIDENTIAL
Owner	Neha Gupta	Created Date	2025-08-25
Related Scenario ID	Not scenario-specific	Document Type	Project Document

1. Purpose

This document covers the onboarding of GreenCart Organics Pvt. Ltd. (S003), a subscription-first organic grocery business, and records the closure position handed to the account team. GreenCart was the first perishable-category seller onboarded on the platform, so several standard onboarding assumptions had to be varied.

2. What Made This Onboarding Different

Three characteristics separated GreenCart from previous onboardings.

- Perishable goods.** A missed delivery slot is a write-off, not a reschedule. Standard dispatch SLA definitions, which assume a failed delivery can be retried the next day, do not hold. Fulfilment requirements were therefore expressed against delivery slots rather than against dispatch windows.
- Subscription ordering.** GreenCart's customers buy a recurring weekly basket. Orders arrive in predictable batches tied to slot cut-offs rather than being distributed through the day. Capacity planning is concentrated rather than smooth, and a failure at a slot cut-off affects an entire cohort at once.
- Connector-based integration.** GreenCart runs its storefront on Shopify and did not have the engineering capacity to build a direct integration. A connector bridge was used instead, which shortened the project considerably but introduced a translation layer between Shopify objects and Seller API calls.

3. Timeline

Date	Milestone	Outcome
2025-05-27	Commercial agreement signed	Silver tier, fortnightly settlement
2025-06-10	KYC and food-category compliance verification	Approved with FSSAI licence on file
2025-06-24	Perishable category configuration	Slot-based fulfilment model enabled
2025-07-08	Connector bridge provisioned in sandbox	Shopify to Seller API mapping confirmed
2025-07-22	Dark store verification, three cities	All three approved
2025-08-04	Pilot with 120 subscription customers	2 slot misses, both process-related
2025-08-11	Go-live	Account activated on Silver tier
2025-08-25	Two-week review and closure	Passed, three open items

4. Configuration at Go-Live

Area	Configuration
Tier	Silver
Settlement	Fortnightly, T+2 payout
Commission	9.2 percent average, grocery band
Returns	Not applicable; refund-on-report for quality complaints
Fulfilment model	Slot-based, three dark stores
Catalogue	~5,400 SKUs at go-live, grown to ~6,200 since
Integration	Shopify connector bridge, webhook order intake
Label generation	Shipment Label Service, primary provider SwiftLane

The refund-on-report arrangement is a category exception. A customer reporting a quality issue on fresh produce is refunded without a physical return, because returning perishable goods has no commercial value and creates a food-safety handling problem. This exception is the reason refund processing correctness matters more on this account than on any other.

5. Pilot Findings

The pilot ran from 4 to 10 August 2025 with 120 subscription customers across one city.

- 118 of 120 baskets delivered within slot.
- Two slot misses, both caused by a manual handover step at the dark store

rather than by platform behaviour. GreenCart revised its picking cut-off.

- Order intake through the connector was correct for all 120 orders.
- One defect found: the connector did not propagate slot metadata on order

amendments, so an amended order lost its delivery slot. Fixed before go-live.

6. Open Items at Closure

ID	Item	Owner	Target
OI-1	Failover provider configuration for label generation	Operations	2025-10-31
OI-2	Settlement frequency review once volume stabilises	Business	2026-01-31
OI-3	Connector monitoring for translation failures	Engineering	2025-11-28

Open item OI-1 was recorded as configured in October 2025. The June 2026 label failover incident later established that the backup provider credentials were stored but never validated, so the failover path had never actually been exercised. The closure evidence for OI-1 was a configuration entry rather than a successful failover test.

Open item OI-2 became the subject of the January 2026 tier upgrade and payment terms decision.

7. Handover

Function	Owner	Department
Commercial relationship	Aditya Verma	Business
Support queue handling	Rahul Sharma	Support
Operational procedures	Neha Gupta	Operations

8. Lessons Recorded

1. A configuration entry is not evidence that a failover path works. The Seller Onboarding Runbook was amended in July 2026 to require a live failover test before a failover item can be closed.
2. Category exceptions, such as refund-on-report, should be recorded against the account rather than held as tribal knowledge. This was done here and proved useful during the September 2026 refund incident.
3. Connector-based integrations need explicit monitoring of the translation layer, because failures there present as seller-side problems.
