

TKT-2026-0312-114 - Settlement payout short by INR 4,82,000

Support Ticket | Support

Document ID	TKT-2026-0312-114	Seller ID	S001
Department	Support	Classification	CONFIDENTIAL
Owner	Rahul Sharma	Created Date	2026-03-12
Related Scenario ID	SC-001	Document Type	Support Ticket

Ticket Header

Field	Value
Ticket ID	TKT-2026-0312-114
Seller	S001 - Aurelia Home Decor
Raised by	Ritika Bansal, Seller Operations Lead
Channel	Seller portal, with spreadsheet attachment
Raised at	2026-03-12 09:48 IST
Priority	P1 - Critical (financial impact, confirmed)
Category	Settlement and payout
Assigned to	Rahul Sharma, Support
Escalated to	Vikram Singh, Engineering
Closed at	2026-03-14 18:05 IST
Final status	Resolved - shortfall credited

What the Seller Reported

Ritika attached her own reconciliation of the settlement cycle covering 5 to 9 March 2026 and stated that the net payout was INR 4,82,000 lower than her calculation. Her exact words in the ticket were that the commission and gross values matched line by line, but "the reversal block is roughly double what it should be".

She had already done the work of isolating the problem. Her spreadsheet showed 1,914 reversal entries where her own order export showed 1,914 returns, but the total deducted was almost exactly twice the expected value.

First-Line Verification

I pulled the settlement report for the same cycle and compared it against the order and return event history.

- Gross merchandise value: matched.
- Commission: matched.
- Adjustments: matched.
- Reversals: **1,914 entries, each appearing twice under a distinct ledger

entry ID but referencing the same return.**

That was enough to confirm the seller was right and that this was not a reconciliation misunderstanding. I did not attempt further diagnosis, because duplicated ledger entries are a platform data problem rather than a configuration problem.

Escalation

Escalated to Engineering at 11:20 IST on 12 March, within the P1 escalation window defined in the Seller Escalation Policy (POL-BIZ-004). Vikram Singh picked it up and opened incident INC-2026-0312.

I also flagged the ticket to Aditya Verma at 11:25 IST, because Aurelia's finance team reconciles every cycle and a two-day payout delay on a Gold account needed an account-manager conversation rather than a support update.

Timeline

Time (IST)	Event
12 Mar 09:48	Ticket raised with reconciliation attached
12 Mar 10:35	Duplicate reversal entries confirmed by Support
12 Mar 11:20	Escalated to Engineering, INC-2026-0312 opened
12 Mar 11:25	Account manager notified
12 Mar 14:10	Engineering confirmed deduplication key defect
12 Mar 16:00	Payout for the cycle held pending correction
13 Mar 10:30	Seller call held with Aurelia finance
13 Mar 15:45	Hotfix deployed, affected batch reprocessed
14 Mar 12:20	Corrected payout verified by Operations
14 Mar 16:30	INR 4,82,000 credited to the seller
14 Mar 18:05	Seller confirmed receipt, ticket closed

Root Cause as Reported Back to Support

Engineering found that the deduplication key used by the settlement ledger no longer included the order identifier for reversal entries. The key was changed during the v1.8 to v1.9 schema migration. When the batch was reprocessed after a transient job failure, the ledger treated each reversal as a new entry rather than as an existing one, so every reversal was deducted a second time.

Full technical detail is in INC-2026-0312.

Resolution

The deduplication key was corrected to include order identifier plus entry type. The affected batch was reprocessed, Operations verified the corrected payout against the Payment Recovery Runbook (OPS-RB-004), and INR 4,82,000 was credited on 14 March 2026. The applicable rule is the platform's accountability for the accuracy of a computed settlement under the Payment and Settlement Policy (POL-FIN-002).

Seller Communication

Three updates were sent: on escalation, after root cause was identified, and on credit. Aditya Verma held a call with Aurelia's finance lead on 13 March. Ritika's closing comment on the ticket was that the response was acceptable but that she "should not have been the detection mechanism for a platform accounting error" - a point that went directly into the follow-up project.

Follow-Up Raised From This Ticket

Support raised one follow-up: there was no internal alert for a settlement variance, so the platform had no way to know about this before the seller did. This became the automated variance detection workstream in the settlement reconciliation hardening project.
