

TKT-2026-0519-207 - Published stock does not match warehouse position

Support Ticket | Support

Document ID	TKT-2026-0519-207	Seller ID	S002
Department	Support	Classification	CONFIDENTIAL
Owner	Rahul Sharma	Created Date	2026-05-19
Related Scenario ID	SC-002	Document Type	Support Ticket

Ticket Header

Field	Value
Ticket ID	TKT-2026-0519-207
Seller	S002 - BluePeak Electronics
Raised by	Sameer Khanna, Head of Marketplace Integrations
Channel	Seller portal, escalated to phone within the hour
Raised at	2026-05-19 08:15 IST
Priority	P1 - Critical (oversells in progress)
Category	Inventory synchronisation
Assigned to	Rahul Sharma, Support
Escalated to	Vikram Singh (Engineering), Neha Gupta (Operations)
Closed at	2026-05-23 14:50 IST
Final status	Resolved - scheduler and mapping corrected, oversells refunded

Report

Sameer reported that BluePeak was receiving orders for items that were out of stock in its warehouses, and that the volume was increasing. He provided 40 example order identifiers and the corresponding warehouse stock positions, which showed zero available for all 40.

He escalated to phone at 08:52 because, in his words, "every minute this continues is another cancellation I have to explain to a customer".

Why This Was P1 Immediately

An oversell is not recoverable. The order has been accepted, the customer has paid, and the seller cannot fulfil. Every additional minute of a stale feed creates more orders that must be cancelled and refunded. On an account with BluePeak's throughput the rate of harm is high.

Investigation

Check	Finding
Last successful stock batch run	Reported as successful

Check	Finding
Timestamp of data in the last run	26 hours behind the seller's source
Affected SKU count with stale availability	18,400
Oversell orders identified	412
Both fulfilment centres affected	Yes, but not uniformly

The run had completed without error. That was the confusing part: the monitoring said the job succeeded, and it had, in the sense that it processed a file. The file it processed was not current.

I escalated at 09:30 with a specific framing: the job is succeeding and the data is stale, so the fault is in what the job is reading or when it is scheduled, not in whether it ran.

Immediate Mitigation

On the 10:15 call with Sameer we agreed that BluePeak would disable the affected listings rather than continue trading on unreliable availability. That decision was the seller's and it was the right one. It stopped new oversells within about 20 minutes.

Cause

Engineering found two independent faults acting together. The batch scheduler applied a fixed UTC offset while the stock window is computed in IST, and a SKU mapping table left over from the March catalogue restructure was still being consulted. Neither alone would have breached the six-hour freshness requirement. Together they produced up to 26 hours of drift.

Detail is in INC-2026-0519.

Timeline

Date and time (IST)	Event
19 May 08:15	Ticket raised with 40 example orders
19 May 08:52	Seller escalates by phone
19 May 09:10	Support confirms 26-hour data staleness
19 May 09:30	Escalated to Engineering and Operations
19 May 10:15	Seller call, listings disabled by agreement
19 May 13:40	Scheduler timezone defect identified
19 May 16:20	Stale mapping table identified as second factor
20 May 09:00	Scheduler pinned to Asia/Kolkata, mapping table removed
21 May 11:30	SKU mapping rebuilt, full resynchronisation executed
21 May 15:00	Seller re-enables listings after verification
23 May 12:10	412 oversold orders refunded with priority handling
23 May 14:50	Ticket closed

Resolution

Scheduler pinned to an explicit timezone, stale mapping removed, mapping rebuilt against the current catalogue version, full resynchronisation executed. All 412 oversold orders were refunded with priority handling on 23 May. Operations opened a remediation project which added a per-feed freshness metric and an alert above six hours.

Support Observation

The monitoring answered the wrong question. It told us whether the job ran. It did not tell us whether the data was current. A job that succeeds while publishing 26-hour-old data is worse than a job that fails, because nobody looks at it.
