

TKT-2026-0602-217 - Settlement feed not updating, reconciliation warnings

Support Ticket | Support

Document ID	TKT-2026-0602-217	Seller ID	S002
Department	Support	Classification	CONFIDENTIAL
Owner	Rahul Sharma	Created Date	2026-06-02
Related Scenario ID	SC-011	Document Type	Support Ticket

Ticket Header

Field	Value
Ticket ID	TKT-2026-0602-217
Seller	S002 - BluePeak Electronics
Raised by	BluePeak finance operations, via Sameer Khanna
Channel	Seller portal
Raised at	2026-06-02 13:30 IST
Priority	P2 - High (no customer impact, financial reporting affected)
Category	Settlement and reporting
Assigned to	Rahul Sharma, Support
Escalated to	Vikram Singh, Engineering
Closed at	2026-06-04 10:15 IST
Final status	Resolved - consumer stabilised, events replayed

Issue as Described

BluePeak's finance operations team reported that the settlement feed had not advanced since approximately 04:00 IST. Their reconciliation process runs through the day and had begun producing duplicate-order warnings, which they correctly interpreted as a symptom rather than as the problem.

No customer-facing impact was reported. Orders were being accepted and fulfilled normally.

Priority Reasoning

I set this at P2 rather than P1. Orders were flowing, customers were unaffected, and no money had moved incorrectly. What was affected was the seller's ability to reconcile in near-real-time, and the settlement cycle for the period had not yet closed, so there was time to correct the data before any payout was computed.

Had the cycle been closing that day this would have been P1.

Diagnosis Path

Because the seller reported a stale feed rather than an error, the first question was whether data was being produced at all.

Check	Result
Orders being accepted	Yes, normal volume
Order events present on the event bus	Yes, 6,700 accumulated
Order event consumer running	Yes, process healthy
Consumer committing offsets	No commits since 04:02 IST
Settlement feed last updated	04:07 IST, nine hours stale at time of diagnosis

The consumer was running and not making progress. That combination pointed at a rebalance problem rather than a crash or a poison message, and I escalated on that basis at 14:05 IST.

Cause

The consumer group had entered a rebalance loop following a partition expansion earlier that week. The maximum poll interval was shorter than the time needed to process a batch, so the broker considered the consumer dead, triggered a rebalance, and the cycle repeated. Events were read and reprocessed repeatedly but never committed.

The duplicate-order warnings in BluePeak's reconciliation were caused by the same reprocessing.

Engineering did not raise a separate incident report. The defect was a configuration fault with a known fix, and the remediation was absorbed into the S002 throughput and resilience programme as workstream WS-B, consumer stability and lag control.

Timeline

Time (IST)	Event
02 Jun 04:02	Last successful offset commit
02 Jun 04:07	Settlement feed stops advancing
02 Jun 13:30	Ticket raised by seller finance operations
02 Jun 13:55	Support confirms consumer lag and no commits
02 Jun 14:05	Escalated to Engineering, INC-2026-0602 opened
02 Jun 15:10	Rebalance loop confirmed, poll configuration identified
02 Jun 17:30	Configuration corrected, consumer group stabilised
02 Jun 19:45	Backlog of 6,700 events processed
03 Jun 09:00	Settlement feed fully current, warnings cleared
03 Jun 14:00	Seller confirms reconciliation clean
04 Jun 10:15	Ticket closed

Data Integrity Question

The most important question on this ticket was not how to restart the consumer. It was whether any settlement value had been lost or double counted, given that events had been reprocessed many times without commit.

Operations verified against the Payment Recovery Runbook (OPS-RB-004) that the downstream settlement computation was idempotent on order identifier, so reprocessing produced no duplicate financial effect. No

value was lost and none was double counted. The duplicate warnings were in the seller's reconciliation view, not in the settlement ledger.

I recorded this explicitly because the seller asked the same question, and the answer needed to be verified rather than assumed.

Resolution

Poll interval and batch size were tuned, the consumer group stabilised, and the 6,700-event backlog was processed by 19:45 the same day. The feed was fully current by the following morning. Consumer lag alerting above 15 minutes was added as requirement ORD-4 and delivered in September 2026.

Note for Future Tickets

A stale feed with a healthy process and no error log is a lag problem until proven otherwise. Check offset commits before anything else.
