

TKT-2026-0618-233 - Shipping labels not generating, deliveries at risk

Support Ticket | Support

Document ID	TKT-2026-0618-233	Seller ID	S003
Department	Support	Classification	CONFIDENTIAL
Owner	Rahul Sharma	Created Date	2026-06-18
Related Scenario ID	SC-005	Document Type	Support Ticket

Ticket Header

Field	Value
Ticket ID	TKT-2026-0618-233
Seller	S003 - GreenCart Organics
Raised by	Ananya Rao, Co-founder and Operations
Channel	Phone, ticket created by Support
Raised at	2026-06-18 06:50 IST
Priority	P1 - Critical (perishable goods, fixed delivery slots)
Category	Fulfilment and shipping
Assigned to	Rahul Sharma, Support
Escalated to	Neha Gupta (Operations), Vikram Singh (Engineering)
Closed at	2026-06-19 15:30 IST
Final status	Resolved - failover executed, labels backfilled

Report

Ananya called at 06:50, before the morning slot cut-off. Her dark store teams had picked and packed the morning subscription baskets and could not generate shipping labels. The requests were timing out.

She was explicit about the consequence and she was right to be: "if these don't move in the next ninety minutes the produce is a write-off, not a delay". Fresh groceries on a missed slot are not re-delivered, they are discarded.

Why This Is Always P1 On This Account

GreenCart is the only perishable seller on the platform. On any other account a label generation failure delays a dispatch. Here it destroys the goods and the order value. The Seller Escalation Policy treats perishable fulfilment failures as P1 by default and that is the correct default.

First-Line Findings

Check	Finding
Shipment Label Service health	Degraded, high error rate

Check	Finding
Primary provider (SwiftLane) API	Timing out, provider-side degradation
Expected behaviour	Automatic failover to backup provider RapidPost
Observed behaviour	No failover; service retrying primary
Orders in label-pending state	2,100 and rising

The critical observation was that failover had not occurred. The configuration said it should. The service was instead retrying a provider that was clearly unhealthy.

I escalated at 07:12 IST to Operations and Engineering simultaneously, because the fix could be either operational (force the failover) or engineering (why did it not happen).

What Blocked The Failover

The stored RapidPost credentials had expired. The failover path attempted to authenticate at the moment failover was needed, authentication failed, and the service fell back to retrying the primary provider rather than surfacing a credential error.

So the system looked like it was working. It was retrying, logging retries, and reporting a degraded primary provider. It never reported the actual blocker.

Timeline

Time (IST)	Event
18 Jun 05:40	SwiftLane API degradation begins
18 Jun 06:50	Seller calls Support before morning slot cut-off
18 Jun 07:12	Escalated to Operations and Engineering
18 Jun 07:35	Failover failure traced to expired backup credentials
18 Jun 08:05	RapidPost credentials rotated
18 Jun 08:20	Failover executed manually, labels begin generating
18 Jun 09:15	Backlog of 2,100 labels cleared
18 Jun 10:00	640 orders confirmed as having missed their slot
18 Jun 14:00	Refunds issued for the 640 affected orders
19 Jun 11:00	Seller call on prevention
19 Jun 15:30	Ticket closed

Impact

Measure	Value
Orders in label-pending state	2,100
Orders that missed their delivery slot	640
Orders recovered into a later slot	1,460
Refunds issued	640, full value

Measure	Value
Produce written off	Estimated 640 baskets

Resolution

Backup provider credentials were rotated and failover was executed manually at 08:20. The label backlog cleared within an hour. 640 orders that had missed their slot were refunded in full the same day, using the refund-on- report category exception recorded against this account.

Prevention: an automated credential-expiry monitor covering both providers, and a failover pre-flight check that validates backup credentials on a schedule rather than at the moment of need.

Link To An Earlier Record

This ticket closed an old gap. Open item OI-1 from GreenCart's 2025 onboarding project required failover provider configuration and was recorded as complete in October 2025. The closure evidence was a configuration entry. Nobody had ever executed a failover.

That is why milestone M3 in the seller's conditional upgrade decision now requires a **live** failover test rather than a configuration check. The test was performed on 15 July 2026 and passed.

Seller Position

Ananya accepted the refunds and the prevention plan. Her comment on the 19 June call was that she had assumed a documented failover meant a tested failover. That assumption was reasonable and the platform had not earned it.
