Owner	Admin	Created Date	2025-10-06
Related Scenario ID	Not scenario-specific	Document Type	Organization Reference

1. Company Overview

Nexora Commerce Pvt. Ltd. operates Nexora Marketplace, a multi-category online marketplace headquartered in Bengaluru, Karnataka, India. The company was founded in 2019 and connects third-party sellers with retail customers across India. Sellers list catalogues on the platform, receive orders through platform integrations, fulfil those orders either from their own warehouses or through logistics partners, and are paid through a scheduled settlement cycle.

The platform is organised around a small number of core services. The Catalog Service holds listings and attributes. The Order Service accepts and routes orders. The Inventory Sync Service keeps seller stock levels aligned with published listings. The Settlement and Payout Service computes seller earnings, deductions and reversals. The Invoicing Service issues tax documents. Fulfilment integrations connect the platform to courier partners. An event bus carries order, refund and settlement events between services.

Because sellers differ substantially in size, business model and integration maturity, knowledge about a seller accumulates in different places: account documents owned by Business, tickets owned by Support, incident reports owned by Engineering, runbooks and recovery records owned by Operations, and access and security records owned by IT. This document defines the organisational model that governs who may read which part of that knowledge.

2. Department Structure

The company operates five departments. Each department owns a distinct category of enterprise knowledge and is accountable for the accuracy of the documents it produces.

Department	Primary Responsibility
Business	Owns seller relationships, commercial terms, account strategy and tier management.
Support	Front-line seller support, ticket triage, escalation and customer communication.
Engineering	Owns platform services, integrations, reliability and incident remediation.
Operations	Runs settlement, fulfilment, onboarding operations and service recovery procedures.
IT	Owns identity, access, security operations and platform administration.

2.1 Business

Business owns the commercial relationship with each seller. Account Managers hold a named portfolio of sellers, negotiate commercial terms, maintain account overviews and decision records, and represent the seller internally during escalations. Business is the approving authority for tier changes and commercial exceptions, subject to policy.

2.2 Support

Support is the entry point for every seller-reported problem. Support Engineers triage tickets, reproduce issues, gather evidence, communicate with the seller, and decide whether an issue should be escalated to Engineering or Operations. Support owns the ticket record as the authoritative account of what the seller reported and when.

2.3 Engineering

Engineering owns platform services and their reliability. Software Engineers investigate defects, run incident response for technical failures, publish incident reports with root cause analysis, and implement preventive actions. Engineering owns the incident record as the authoritative technical explanation of a failure.

2.4 Operations

Operations runs the repeatable procedures of the marketplace: seller onboarding execution, settlement operations, fulfilment coordination, service recovery and post-incident verification. Operations owns runbooks and procedures, and it is accountable for confirming that a recovery actually restored correct data, not merely that a service returned to health.

2.5 IT

IT owns identity, access administration, security monitoring and platform administration. The Platform Administrator maintains user records, seller scope assignments and clearance levels, and leads security incident handling together with Engineering.

3. User Directory

The organisation model for this dataset uses exactly five identities. Each identity has a department, a role, a seller scope and a clearance level.

User ID	Name	Department	Role
U-001	Aditya Verma	Business	Account Manager
U-002	Rahul Sharma	Support	Support Engineer
U-003	Vikram Singh	Engineering	Software Engineer
U-004	Neha Gupta	Operations	System Engineer
U-005	Admin	IT	Platform Administrator

3.1 User Profiles

Aditya Verma - Account Manager, Business

Aditya manages the commercial relationship for **S001 (Aurelia Home Decor)** and **S003 (GreenCart Organics)**. He owns account overviews, decision records and commercial exception requests for those two sellers. He is routinely involved in settlement disputes and tier decisions, and he is the internal voice of the seller during escalations. His clearance is CONFIDENTIAL, which means he may read seller-specific account material for his own portfolio but not material classified RESTRICTED.

Rahul Sharma - Support Engineer, Support

Rahul handles seller-reported issues for **S001** and **S002 (BluePeak Electronics)**. He owns the support ticket record, performs first-line investigation, and coordinates escalation to Engineering or Operations. He participates in most seller calls where a live problem is being discussed. His clearance is CONFIDENTIAL.

Vikram Singh - Software Engineer, Engineering

Vikram investigates and remediates platform defects for **S001** and **S002**. He authors incident reports, performs root cause analysis, and implements preventive actions. He is the technical owner for the settlement ledger, inventory synchronisation, order API and checkout defects recorded in this dataset. His clearance is **CONFIDENTIAL**.

Neha Gupta - System Engineer, Operations

Neha runs operational procedures and recovery verification for **S002** and **S004 (StrideOne Footwear)**. She owns runbooks, executes payment recovery and service recovery procedures, and signs off post-incident verification. Her clearance is **RESTRICTED**, which allows her to read the most sensitive operational and security-adjacent material, but only within her seller scope.

Admin - Platform Administrator, IT

Admin holds **organization-wide** seller scope and **RESTRICTED** clearance. This identity may read any document in the dataset, including security incident material and account suspension records for every seller. Admin is the only identity with cross-portfolio visibility and is therefore also the identity used for access reviews.

4. Seller and Account Scope

A **seller scope** is the list of seller accounts an identity is permitted to see. Scope is assigned by the Platform Administrator, reviewed quarterly, and derived from actual work allocation rather than seniority. An Account Manager holds the sellers in the commercial portfolio. A Support Engineer holds the sellers in the support queue. A System Engineer holds the sellers whose operational procedures are executed by that engineer.

Name	Seller Scope	Clearance	Access Summary
Aditya Verma	S001, S003	CONFIDENTIAL	Only S001, S003 documents up to CONFIDENTIAL
Rahul Sharma	S001, S002	CONFIDENTIAL	Only S001, S002 documents up to CONFIDENTIAL
Vikram Singh	S001, S002	CONFIDENTIAL	Only S001, S002 documents up to CONFIDENTIAL
Neha Gupta	S002, S004	RESTRICTED	Only S002, S004 documents up to RESTRICTED
Admin	Organization-wide	RESTRICTED	All sellers, all departments, all classifications

Two consequences of this model matter for anyone reading the dataset.

First, scope overlaps deliberately. S001 appears in the scope of Aditya, Rahul and Vikram, which means three departments legitimately hold different documents about the same seller. S002 appears in the scope of Rahul, Vikram and Neha. S003 appears only for Aditya. S004 appears only for Neha. Only Admin sees all four.

Second, scope alone is not sufficient. A document is readable only when the reader's seller scope includes the document's seller **and** the reader's clearance is at or above the document's classification. Organization-wide documents such as policies and runbooks carry no seller identifier and are governed by classification alone.

5. Classification Levels

Every document in the dataset carries exactly one classification. The four levels are defined below and are applied consistently across all document types.

Classification	Meaning	Typical Content
PUBLIC	May be shared outside the company without review	Published marketplace terms, seller-facing help material
INTERNAL	Readable by any employee regardless of seller scope	Runbooks, standard operating procedures, general policies
CONFIDENTIAL	Seller-specific or commercially sensitive; readable only within seller scope	Account overviews, support tickets, incident reports, call transcripts
RESTRICTED	Sensitive security, access or risk material; readable only at RESTRICTED clearance	Credential exposure records, access control policy detail, suspension risk analysis

5.1 How Classification Is Decided

General operational instructions that describe *how* the company works are INTERNAL, because any employee may need them and they contain no seller-identifying commercial data. The Seller Onboarding Runbook and the Deployment Rollback Procedure are examples.

Anything naming a specific seller together with commercial, financial or defect detail is at least CONFIDENTIAL. Settlement amounts, return rates, ticket histories and incident impact figures fall in this category.

Material that would materially assist an attacker, or that records a security event, credential handling detail or an account risk determination, is RESTRICTED. The credential exposure incident of April 2026 and the account suspension review of September 2026 are handled at this level, as is the access-control detail inside the Data Access Policy.

6. Organisational Terminology

Term	Definition
Seller scope	The set of seller accounts an identity may access
Clearance	The highest classification an identity may read
Organization-wide	A document or scope not tied to a single seller
Scenario	A single real business event documented from several departmental perspectives
Scenario ID	The shared identifier (SC-0NN) that links documents describing one event
Ticket	The Support record of a seller-reported problem
Incident	The Engineering record of a technical failure, identified as INC-YYYY-MMDD
Runbook	An Operations procedure describing how to execute or recover an activity
Settlement cycle	The scheduled computation and payout of seller earnings
Tier	The commercial band of a seller account: Silver, Gold or Platinum

7. Sellers in Scope

The dataset contains four seller accounts. They are deliberately different in category, business model, integration style and operational profile.

Seller ID	Company	Category	Tier	Onboarded
S001	Aurelia Home Decor	Home & Living	Gold	2023-02-14
S002	BluePeak Electronics	Consumer Electronics	Platinum	2022-06-01
S003	GreenCart Organics	Grocery & Fresh	Silver (conditional Gold upgrade in progress)	2025-08-11
S004	StrideOne Footwear	Fashion & Footwear	Gold	2025-09-22

S001 is an own-brand home decor seller integrated through the real-time Seller API, with settlement and invoicing sensitivity. S002 is the largest account on the platform, a Platinum electronics reseller integrated through nightly SFTP batch feeds, with throughput and data-quality exposure. S003 is a subscription grocery business with perishable delivery SLAs and a conditional tier upgrade in progress. S004 is a dropship footwear seller with no owned warehouse, where catalogue attribute accuracy directly drives return rates and account standing.

8. Document Metadata Convention

Every document in this dataset begins with the same metadata block so that scope and sensitivity can be determined without reading the body.

Field	Purpose
Document ID	Stable unique identifier for the record
Seller ID	Seller the document belongs to, or Organization-wide
Department	Owning department, which determines authorship and accountability
Classification	One of PUBLIC, INTERNAL, CONFIDENTIAL, RESTRICTED
Owner	Named identity accountable for the document
Created Date	Date the record was created
Related Scenario ID	The scenario or scenarios the document belongs to
Document Type	Category of record, for example Support Ticket or Incident Report

This document describes the organisational model only. It does not implement access control. It records the seller scopes, clearance levels and classification rules that a permission-aware system would later need to enforce.

9. Review

Version	Date	Change	Owner
1.0	2025-10-06	Initial organisation and access model	Admin
1.1	2026-02-02	Added classification decision guidance	Admin
